

ABSTRACT

The present invention relates to a method for coating a ship-bottom paint and more particularly, to a method for coating a ship-bottom paint comprising the steps of:

5 coating a coating composition comprising a liquid type room temperature curable organic resin, and 10 to 400 weight parts, based on 100 weight parts of the liquid type room temperature curable organic resin, of glass powder on the bottom of a ship; and spraying glass beads on the surface

10 of the resin before the resin of the coating composition is cured, followed by curing. The method for coating a ship-bottom paint according to the present invention can effectively prevent attachment of marine organisms on the ship bottom while simultaneously providing excellent

15 abrasion resistance, durability, impact resistance and scratch resistance. Also, the coating can be readily constructed and reduce surface resistance of a large vessel during sailing, improving economical efficiency.
